## dU (Deoxyuridine) phosphoramidite

http://www.lumiprobe.com/p/du-phosphoramidite

dU amidite enables the addition of deoxyuridine nucleoside to the DNA chain to synthesize modified oligonucleotides. Deoxyuridine (dU) is a derivative of the nucleoside uridine and has H instead of hydroxy group at the 2'-position of the ribose. This amidite contains DMT at the 5'-end.

Oligos modification with dU affects the melting profiles of oligo duplexes via integrating 2'-deoxyuridine into nucleic acid sequences.

dU (Deoxyuridine) phosphoramidite can serve for oligonucleotide probes and as a research tool for duplex stability studies and those of DNA damage and repair mechanisms.

## General properties

Appearance: white to pale yellow powder

Molecular

730.79

weight:

CAS number: 109389-30-2Molecular  $C_{30}H_{47}N_4O_8P$ 

formula:

IUPAC name: 5'-O-(4,4'-Dimethoxytrityl)-2'-deoxyuridine-3'-O-[O-(2-cyanoethyl)-N,N'-diisopropylphosphoramidite]

Solubility: good in acetonitrile, DCM

Quality NMR <sup>1</sup>H, NMR <sup>31</sup>P, HPLC-MS (95%)

control:

WHITE 11, WHITE 17, 111 LC 1415 (3570)

Storage

Storage: 12 months after receival at -20°C in the dark. Transportation: at room temperature for up to 3

conditions: weeks. Desiccate.

Legal statement:

This Product is offered and sold for research purposes only. It has not been tested for safety and efficacy in food, drug, medical device, cosmetic, commercial or any other use. Supply does not express or imply authorization to use for any other purpose, including, without limitation, in vitro diagnostic purposes, in the

manufacture of food or pharmaceutical products, in medical devices or in cosmetic products.

## Oligo synthesis details

Diluent: acetonitrile

Coupling standard coupling, identical to normal nucleobases

conditions:

Cleavage ammonia, 2 h at room temperature

conditions:

Deprotection identical to protected nucleobases

conditions:
